light flashes are described. Problems of vision and detection under threshold and suprathreshold conditions are outlined, and the blinding effect of white and colored light flashes when observed against a dark background is analyzed; tables of data are presented for engineering calculations. Chapter VI is an application of flashing lights.

TITLE: Methionine sulfoximine and the metabolism of cerebral tissue

SOURCE: Ceskoslovenska fysiologie, v. 14, no. 2, 1965, 142-151

TOPIC TAGS: biochemistry, biologic metabolism, pathology, brain tissue, organic sulfur compound, organic imine compound

ABSTRACT: Use of methionine-sulfoximine (MSI) for inducing of cramps is described. It is sometimes found in flour bleached with NaCl_3 . MSI causes epileptic type convulsions in many animals. State of paroxysm starts after 4 - 18 hours, and lasts several hours; an analysis of individual phases of the pathological process becomes possible. A single dose may cause several convulsions. Energetic changes in metabolism are the result of the fits rather than their cause. MSI causes increase in lactic acid in the brain; acetylcholine in a paroxysmal process is discussed. Intracellular K decreases, and Na increases during the spasms in the brain cells. Metabolism of

free amino-acids during the MSI model convulsion of epilepsy is described. Location of individual acids in various organs, and the metabolism of proteins during the attack is discussed. Administration of MSI inhibits glutamic synthesis; lowering of glutamine levels does not induce paroxysm. Orig. art. has: 1 figure, 1 graph, 2 tables.

Utilization of furfural. I. Production of maleic anhydride by vapor-phase oxidation. L. Mészáros and S. Földesik (Univ. Szeged, Hung.). *Acta Univ. Szegediensis, Sectio Phys. et Chem. (N. S.)*, 4, 144-52 (1953) (in English).
Catalyst A, prep'd. from 70 g. NH_4VO_3 in 500 ml. H_2O and 1000 ml. pumice stone, stirred, then air-dried, transferred to a reactor, heated 8 hrs. at 350°, and activated with 50 l. air during 0.5 hr., or Catalyst B, similarly prep'd. but promoted by ferric molybdate were used. 2- $\text{C}_2\text{H}_5\text{OCHO}$ (I) (20 ml./hr.) fed through the evaporator and mixed with air was passed over the catalyst. The optimum temp. was 270° [85% yield of maleic anhydride (II) with catalyst B, with 740 moles air/mole II]. With Catalyst A, the optimum temp. was 330° (37% yield of II) but over-oxidation gave by-products. The reactor consisted of 4 square-shaped tubes 20 × 20 × 90 cm. imbedded in an Al block, electrically heated. MeOH did not inhibit over-oxidation with formation of by-products. II. Preparation of pyrrolidine from tetrahydrofuran in the vapor phase. L. Mészáros and M. Bartók. *Ibid.* 163-60.—Tetrahydrofuran (I) and NH_3 , in the vapor phase, are passed over γ -alumina in Fe, stainless steel, or alumina reactors (2200-3180 cc. catalyst vol.) optimum yields of about 20% pyrrolidine were obtained at 380° with 10 moles NH_3 /mole I, and a contact time of 12-20 sec. The by-products were pyrrole and carbazole. III. Preparation of pyrrole from furan in the vapor phase. *Ibid.* 161-4.—Furan (II) and NH_3 passed over γ -alumina (activated at 400° by air) gave optimum yields of pyrrole of 30% at 475°, with a feed rate of 120 ml. II and a molar ratio of NH_3 to II of 2:1. The same app. was used as in the previous paper.

FOLIO 5

✓ Investigation of the formation of *N*-substituted carboxylic esters with the use of various halo carboxylic esters. S. Vojdán and B. Matkovics. *Acta Univ. Szegediensis Acta Phys. et Chim. Ser.* No. 1-2, 43-6 (1959) (in English).—Et piperidinoacetate (I) (b. 68°; picrate m. 122°), Et morpholinooacetate (II) (b. 81°; picrate m. 120°), and Et 1-pyrrolidinyacetate (III) (b. 89-9.6; picrate m. 118.5°) were prep'd. by the addn. of a soln. of 1 mole Et chloro-, bromo- or iodoacetate in 2.5 moles anhyd. benzene dropwise into 1 mole amine in 2.5 moles benzene. The amine hydrohalide formed as a by-product was removed by filtration. Highest yields (85, 71, and 77%, resp.) were obtained when Et bromoacetate was used. The order of reactivity of the amines was piperidine > pyrrolidine > morpholine. The hydrochlorides of I (m. 117°), II (decompd., 170°) and III (m. 183.5°) and the methiodides of I (m. 160-60.3°) and II (m. 132.5°) were prep'd. The methiodide of III could not be isolated.

SOURCE: Kiserletes Orvostudomany, v. 17, no. 1, 1965, 43-50

TOPIC TAGS: biochemistry, experiment animal, drug effect, pharmacology

ABSTRACT: It has been shown that 1-piperidino-2-phenyl-ethane (FMP-199) and 1-piperidino-2-phenyl-ethene (FMP-228) have an elective curare-like effect on cats, rabbits, mice and frogs. They have practically no muscarine and nicotine-like effects. The curare-like activity is elicited by depolarization of the motor endplates. This is indicated by the fact that they cause fibrillar spasms and the blocking of the myoneural transmission can not be inhibited by prostigmine. According to the data, curare-like activity is present in such compounds which contain one tertiary N atom in which a phenyl radical is located at 4.6-5 Å distance from it. This ring is definitely needed for the effect since 1-N-piperidino-butane,

"Pharmacology of a New Neuroleptic Compound, N,N'-Di(Piperidinomethyl)-3,3'-Diindolyl-Methane"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricæ, Vol 29, No 3-4, 8 Jun 1966, pp 299-317.

Abstract: [English article] The title compound causes catalepsy, hypothermia, and reduction in metabolic rate even at low doses (3-5 mg /kg) in rabbits, cats, and dogs. The effect develops slowly and lasts several days. In anesthetized cats it reduces respiration rate, blood pressure, and inhibits carotid sinus pressor reflex. The vasomotor response to carbon dioxide remains. It has no antihistaminic, adrenolytic, antiacetylcholine, or antinicotinic effect. It does not paralyze the autonomic ganglia but blocks polysynaptic spinal reflexes. The analgesic effect is more effective than that of morphine. The compound potentiates ether, Evipan, and chlorpromazine. It synchronizes the cerebral electrical activity. 26 references, including 5 German, 9 Hungarian, and 12 Western. PURPOSE: This book is intended for mathematicians, physicists, chemists, and
civil and mechanical engineers.

CONTENTS: The book consists of 39 papers by Romanian specialists on problems in
mathematics and technology, particularly mathematics, physics, chemistry, and
mechanics, civil and mechanical engineers. Summaries in Russian and
French or German are given at the end of each article. Some of the articles
are accompanied by references. In parentheses are mentioned, At the back
of the book there are 52 references, all Roman.

1. Hemato-encephalic barrier. I. Effects of hyaluronidase with special reference to the passage of antibiotics. B. Klementei and I. Foldes (Med. Univ., Debrecen). *Acta Physiol. Acad. Sci. Hung.* 5, 139-48 (1954) (in English).—Following parenteral administration in animals, penicillin (I) or streptomycin (II) did not reach inhibitory levels in the cerebrospinal fluid (CSF). Simultaneous administration of I or II with hyaluronidase (III) led to passage of I and II into CSF. The action of III was increased by histamine (IV), not influenced by pyribenzamine or antistine, and inhibited by CaCl_2 or rutin. III induced no histological changes in the *membrana limitans gliae* (V). II. Effects of histamine with special reference to the passage of antibiotics. I. Foldes and B. Klementei. *Ibid.* 149-62.—In cats, rabbits, and guinea pigs IV, 0.2 mg /kg, intravenously, given prior to I or II made it possible to recover therapeutic levels of I and II from CSF. I, when given intracisternally, did not pass into the blood unless I was given with IV. The effect of IV lasted 60 min. The effect of IV was inhibited by pyribenzamine or rutin but not by CaCl_2 . IV entered CSF, increased total N of CSF, and produced some morphologic change in V. S. Ellis

437-442 (Inst. of Pharmacol. and Anat., Histol., Embryol., Med.
Univ., Debrecen, Hungary).—Pretreatment with acetylcholine
(10 µg/kg.) causes parenterally administered penicillin (2000 to
15,000 I.U./kg.) to appear in the c.s.f. in a concn. of 0.1 to 0.25
µg/ml. Simultaneously given eserine greatly increases the amount
of transmitted penicillin. Parenteral atropine has no effect on the
permeability of the blood-brain barrier. Streptomycin, chloram-
phenicol, and terramycin could not be found in the brain or in the
c.s.f. but, following pretreatment with acetylcholine and eserine
their concn. attained demonstrable levels. A. B. I. BEZNÁK.

2696. FOLDES I. and KOMLÓS E. Korányi Tuberk. Int. Körélettani Osztálya, Országos, *Izonikotinsavhidrazid és streptomycin hatása egészséges patkányok felsőbb idegműködésére. Effects of isoniazid and streptomycin on higher nervous activity in normal rats KISERL. ORVOSTUD 1956, 8/5 (510-516) Graphs 1 Tables 1 Illus. 2

After a single s.c. dose of 2.5 or 5 mg./kg. of isoniazid in normal rats, the elaborated positive conditioned reflexes became weaker and the differential inhibitory processes stronger. With 5 mg./kg./day of isoniazid for 50 days there was a temporary weakening of excitation processes and a gradual return to the initial level. At the same time the inhibitory processes were strengthened and this persisted throughout the period of medication. Single doses of 5 or 10 mg./100 g. streptomycin had no demonstrable effect on higher nervous activity and the same applied to chronic administration of 10 mg./100 g. for 30 days.

Title : The Influence of Hydrazide of Isomicotinic Acid on the Higher Nervous Activity of Rats. Investigations by Means of the New Method of Conditioned Reflexes.

Orig Pub : Acta physiol. Acad. sci. hung., 1956, 9, Suppl., 61

Abstract : A single subcutaneous injection of 2.5 or 50 mg/kg of izomiazide led to considerable weakening of the stimulation process and an increase of the inhibition process in rats. In daily introduction of 5 mg/kg for the duration of 50 days, the process of stimulation weakened, and then slowly returned to the initial level. -- V.N. Orlov

2906. (754) EFFECT OF GLUCOSE-1-PHOSPHATE ON CALLUS FORMATION -
Földes I., Mészáros L. and Bot G. Depts of Anat., Histol.,
Emoryol. and Pathophysiol., Med. Univ., Debrecen - ACTA MORPH. ACAD.
SCI. HUNG. 1958, 8/2 (183-191) Illus. 8

Albino rats were treated with 0.5 ml. of a 3% glucose-1-phosphate (G) solution i.m. The animals were examined 5, 8, 11, 14, 21 and 28 days after inducing the fracture and marrow nailing. The evaluation was based on histological (haematoxylin-eosin, Azan) and histochemical (toluidine blue, Hale, Hotchkiss, Rittel-Oleson) studies of the femurs. G seems to accelerate the healing of fractures. This conclusion was based on the following differences between experimental and control animals, respectively: The phase of increased periosteal activity and periosteal cartilage formation developed earlier (in 5 days). The periosteal cartilage was more extensive and the cartilaginous callus developed in 6 to 14 days, as compared to 4 to 21 days. Increased periosteal activity ceased earlier and new bone formation, both periosteally and between the fracture ends, began after 14 to 21 days as compared to 21 to 28 days. During that period hypertrophic osteoblasts appeared along the guiding trabeculae. Consolidation was complete in 21 to 28 days, in the controls only after 28 days. No unequivocal interpretation can be given of certain differences in histochemical reaction. Investigations are in progress to elucidate whether G acts on the process of healing as a specific factor or only as a general phosphate-donor. (I, 9)

FOLDES, ISTVAN EXCERPTA MEDICA Sec 9 Vol 13/3 Surgery Mar 59

1400. (321) THE INFLUENCE OF GLUCOSE PHOSPHATE ON CALLUS FORMATION - A glukóz-1-foszfát hatása a callusképződésre - Földes I., Mészáros L. and Bot G. Orvostud. Egyet. Anat. Szövets- és Fejnödéstani Intézete és Köréleti Intéz., Debrecen - KISERL. ORVOSTUD. 1958, 10/2-3 (236-242) Illus. 8

A comparison was made of fracture healing in white rats treated i.m. with 0.5 ml. of a 3% solution of glucose-1-phosphate (G-1-P) and in untreated control animals. After experimental fracturing and medullary nailing, the development was observed after 5, 8, 11, 14 and 28 days. The condition was assessed on the basis of histological methods (haematoxylin-eosin, Azan) and histochemical methods (toluidine blue, Hale, Hotchkiss, Ritter-Oleson) applied to the femurs. The histological investigations indicated that G-1-P has a favourable effect on fracture healing (the cartilaginous callus develops more rapidly, the new osseous tissue is formed earlier).
